

PRP Male Enhancement - Client Information

PRP Male Enhancement is a non-surgical, completely natural, medical procedure used for improving sexual function as well as enhancing girth and length of the penis. In addition, PRP may help to correct abnormal curvature seen in Peyronie's disease.

Platelet Rich Plasma, or PRP, is a concentrated sample of your own blood composed of high levels of platelets. Importantly, Platelets contain growth factors that are responsible for stimulating tissue generation and repair. PRP is injected along the shaft and head of the penis. The area is frozen first with a topical numbing cream; you may experience some discomfort.

A total of 3 treatments with PRP is recommended, 4 weeks apart each, and booked individually. There is very little down time, and sexual activity may be resumed the same day. The benefits are expected to last 18-24 months. Follow up treatments every 1-2 years would be recommended.

Risks include pain, mild swelling or bruising, or possible allergic reaction to the anesthetic.
